① What And Why \rightarrow Transformers

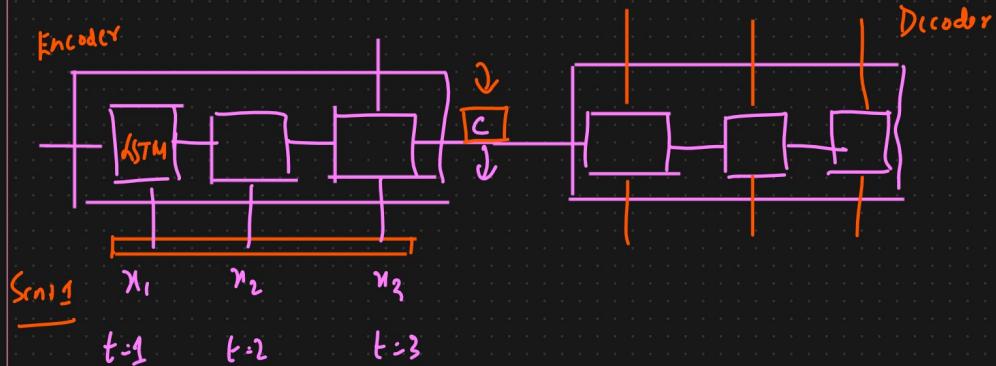

Transformers in natural language processing (NLP) are a type of deep learning model that use self-attention mechanisms to analyze and process natural language data. They are encoder-decoder models that can be used for many applications, including machine translation. \Rightarrow Seq2Seq Task

Eg: Language Translation \rightarrow Google Translation

English \rightarrow French

i/p \Rightarrow Many \rightarrow o/p: Many. $\{$ Length of the sentence $\}$.

Encoder - Decoder

Sentence length $\uparrow\uparrow$

Beam Score $\downarrow\downarrow$

Length Sentence $\uparrow\uparrow$

3.1 DECODER: GENERAL DESCRIPTION

In a new model architecture, we define each conditional probability in Eq. (2) as:

$$p(y_i | y_1, \dots, y_{i-1}, s_i, c_i), \quad (4)$$

where s_i is an RNN hidden state for time i , computed by

$$s_i = f(s_{i-1}, y_{i-1}, c_i).$$

It should be noted that unlike the existing encoder-decoder approach (see Eq. (2)), here the probability is conditioned on a distinct context vector c_i for each target word y_i .

The context vector c_i depends on a sequence of annotations (h_1, \dots, h_{T_s}) to which an encoder maps the input sentence. Each annotation h_i contains information about the whole input sequence with a strong focus on the parts surrounding the i -th word of the input sequence. We explain in detail how the annotations are computed in the next section.

The context vector c_i is, then, computed as a weighted sum of these annotations h_i :

$$c_i = \sum_{j=1}^{T_s} \alpha_{ij} h_j. \quad (5)$$

Figure 1: The graphical illustration of the proposed model trying to generate the i -th target word y_i given a source sentence (x_1, x_2, \dots, x_T) .

Self Attention At Higher And Detailed Level

Self-attention, also known as scaled dot-product attention, is a crucial mechanism in the transformer architecture that allows the model to weigh the importance of different tokens in the input sequence relative to each other.

Idea :

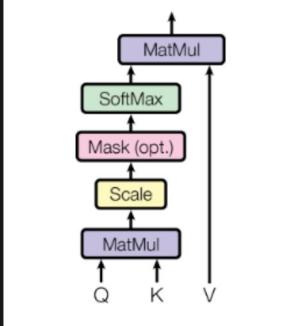

Language Translation Self Attention

Text Summarization Sentence, Dataset

Embedding Layer → Fixed Vector

Scaled Dot-Product Attention

i) Inputs: Queries, Keys, And Values

Model → Queries, Keys And Values

1. Query Vectors (\mathbf{Q}):

Role: Query vectors represent the token for which we are calculating the attention. They help determine the importance of other tokens in the context of the current token.

Importance:

Focus Determination: Queries help the model decide which parts of the sequence to focus on for each specific token. By calculating the dot product between a query vector and all key vectors, the model assesses how much attention to give to each token relative to the current token.

Contextual Understanding: Queries contribute to understanding the relationship between the current token and the rest of the sequence, which is essential for capturing dependencies and context.

2. Key Vectors (K):

Role: Key vectors represent all the tokens in the sequence and are used to compare with the query vectors to calculate attention scores.

Importance:

Relevance Measurement: Keys are compared with queries to measure the relevance or compatibility of each token with the current token. This comparison helps in determining how much attention each token should receive.

Information Retrieval: Keys play a critical role in retrieving the most relevant information from the sequence by providing a basis for the attention mechanism to compute similarity scores.

3. Value Vectors (V):

Role: Value vectors hold the actual information that will be aggregated to form the output of the attention mechanism.

Importance:

Information Aggregation: Values contain the data that will be weighted by the attention scores. The weighted sum of values forms the output of the self-attention mechanism, which is then passed on to the next layers in the network.

Context Preservation: By weighting the values according to the attention scores, the model preserves and aggregates relevant context from the entire sequence, which is crucial for tasks like translation, summarization, and more.

$$\text{Input Sequence} = \left[\text{"The"}, \text{"(A)"}, \text{"(S)"}, \text{"T"} \right]$$

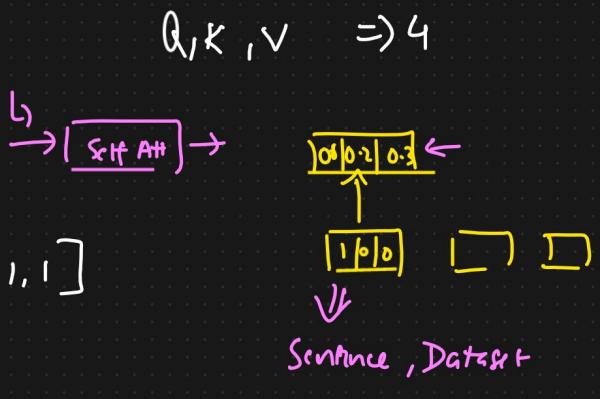

Embedding Size = 4

① Token Embedding

$$F_{\text{The}} = [1 \ 0 \ 1 \ 0]$$

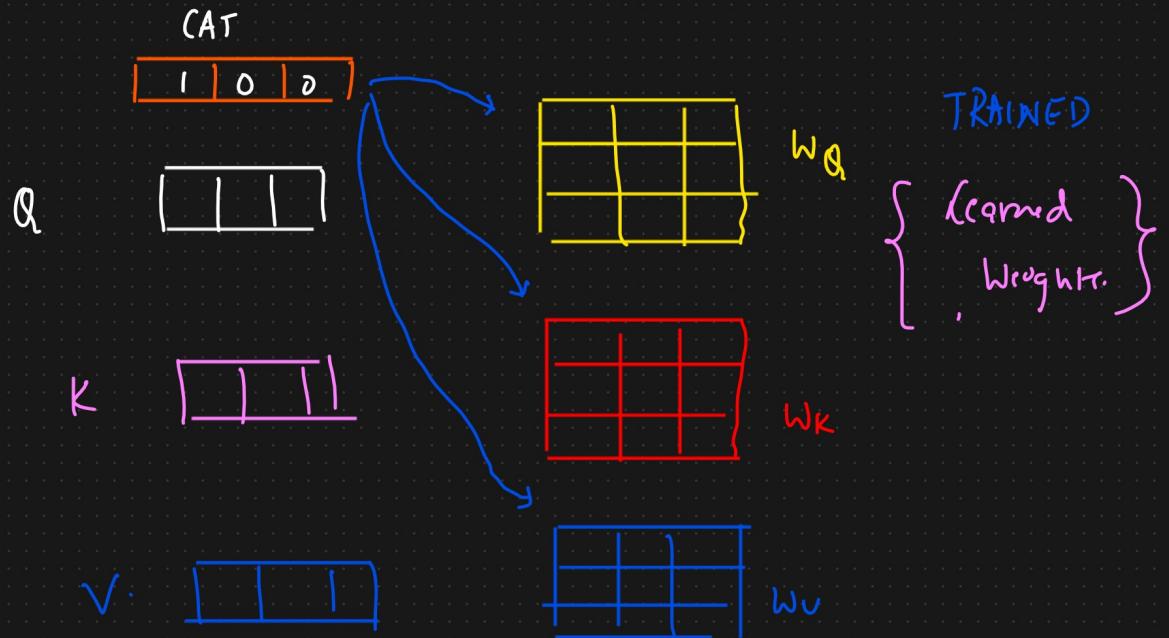

$$E_{CAT} = \begin{bmatrix} 0 & 1 \\ 0 & 1 \end{bmatrix}$$

$$E_{Sqt} = [1, 1, 1, 1]$$

② Linear Transformation

We create Q, K, V by multiplying the embeddings by learned weights matrices W_Q , W_K and W_V .

Let's consider

$$W_Q = W_K = W_V = I \quad \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \leftarrow$$

$$Q_{\text{The}} = [1 \ 0 \ 1 \ 0] \cdot \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = [1 \ 0 \ 1 \ 0]$$

$$K_{\text{The}} = [1 \ 0 \ 1 \ 0]$$

$$V_{\text{The}} = [1 \ 0 \ 1 \ 0]$$

$$\textcircled{1} \quad Q_{\text{The}} = K_{\text{The}} = V_{\text{The}} = [1 \ 0 \ 1 \ 0]$$

$$\textcircled{2} \quad Q_{\text{CAT}} = K_{\text{CAT}} = V_{\text{CAT}} = [0 \ 1 \ 0 \ 1]$$

$$\textcircled{3} \quad Q_{\text{SAT}} = K_{\text{SAT}} = V_{\text{SAT}} = [1, 1, 1, 1]$$

③ Compute Attention Scores

$$\begin{bmatrix} 1 & 0 & 1 & 0 \end{bmatrix} \begin{bmatrix} 1 \\ 0 \\ 1 \\ 0 \end{bmatrix}$$

The

$$\text{Score}(Q_{\text{The}}, K_{\text{The}}) = \begin{bmatrix} 1 & 0 & 1 & 0 \end{bmatrix} \cdot \begin{bmatrix} 1 & 0 & 1 & 0 \end{bmatrix}^T = 2$$

$$\text{Score}(Q_{\text{The}}, K_{\text{CAT}}) = \begin{bmatrix} 1 & 0 & 1 & 0 \end{bmatrix} \cdot \begin{bmatrix} 0 & 1 & 0 & 1 \end{bmatrix}^T = 0$$

$$\text{Score}(Q_{\text{The}}, K_{\text{SAT}}) = \begin{bmatrix} 1 & 0 & 1 & 0 \end{bmatrix} \cdot \begin{bmatrix} 1 & 1 & 1 & 1 \end{bmatrix}^T = 2$$

For the token CAT

$$\text{Score}(Q_{\text{CAT}}, K_{\text{The}}) = \begin{bmatrix} 0 & 1 & 0 & 1 \end{bmatrix} \cdot \begin{bmatrix} 1 & 0 & 1 & 0 \end{bmatrix}^T = 0$$

$$\text{Score}(Q_{\text{CAT}}, K_{\text{CAT}}) = \begin{bmatrix} 0 & 1 & 0 & 1 \end{bmatrix} \cdot \begin{bmatrix} 0 & 1 & 0 & 1 \end{bmatrix}^T = 2$$

$$\text{Score}(Q_{\text{CAT}}, K_{\text{SAT}}) = \begin{bmatrix} 0 & 1 & 0 & 1 \end{bmatrix} \cdot \begin{bmatrix} 1 & 1 & 1 & 1 \end{bmatrix}^T = 2.$$

For the Token SAT

$$\left\{ \begin{array}{l} \text{Score}(Q_{\text{SAT}}, K_{\text{The}}) = \begin{bmatrix} 1 & 1 & 1 & 1 \end{bmatrix} \cdot \begin{bmatrix} 1 & 0 & 1 & 0 \end{bmatrix}^T = 2 \\ \text{Score}(Q_{\text{SAT}}, K_{\text{CAT}}) = 2 \\ \text{Score}(Q_{\text{SAT}}, K_{\text{SAT}}) = 4 \end{array} \right.$$

④ Scaling

We take up the scores and scale down by dividing the scores by the

$$\sqrt{d_K} \Rightarrow d_K = 4 \quad \sqrt{d_K} = 2.$$

Scaling in the attention mechanism is crucial to prevent the dot product from growing too large. \Rightarrow Ensure stable gradients during Training.

d_K is large \rightarrow

① Gradient Exploding

② Softmax Saturation $\{\curvearrowright\}$ \rightarrow Vanishing Gradient Problem.

$$Q = \begin{bmatrix} 2 & 3 & 4 & 1 \end{bmatrix} \quad K_1 = \begin{bmatrix} 1 & 0 & 1 & 0 \end{bmatrix} \quad K_2 = \begin{bmatrix} 0 & 1 & 0 & 1 \end{bmatrix}$$

Without Scaling

$$Q \cdot K_1^T = 2 \times 1 + 3 \times 0 + 4 \times 1 + 1 \times 0 = 2 + 4 = 6.$$

$$Q \cdot K_2^T = 2 \times 0 + 3 \times 1 + 4 \times 0 + 1 \times 1 = 0 + 3 + 0 + 1 = 4$$

* Score $[6, 4] \Rightarrow$ Scaling Not Applied

$$\text{Softmax}([6, 4]) = \left[\frac{e^6}{e^6 + e^4}, \frac{e^4}{e^6 + e^4} \right] = \left[\frac{e^6}{e^6(1 + e^{-2})}, \frac{e^4}{e^4(e^2 + 1)} \right]$$

① Property of Softmax w_Q, w_K, w_V

$$([10, 1]) = \left[\frac{0.99}{\cancel{10}}, \frac{\cancel{0.01}}{\cancel{1}} \right] = \left[\frac{1}{(1 + e^{-2})}, \frac{1}{(e^2 + 1)} \right]$$

Dot product = Large values $\approx [0.88, 0.12]$.

Most of the attention weight is assigned to the first key vector,
very little to the second vector,

With Scaling

① Compute Scaled Dot Product

$$[6, 4] \Rightarrow \text{Scale} \Rightarrow \left[\frac{6}{\sqrt{2}}, \frac{4}{\sqrt{2}} \right] = \left[\frac{3}{\sqrt{2}}, \frac{2}{\sqrt{2}} \right]. \quad \frac{\sqrt{d_K} = \sqrt{4} = \sqrt{2}}{\sqrt{d_K} \uparrow \text{same dimension} \uparrow \text{Variance} \uparrow 2}$$

$$\text{Softmax}\left(\left[\frac{3}{\sqrt{2}}, \frac{2}{\sqrt{2}} \right]\right) = \left[\frac{e^3}{e^3 + e^2}, \frac{e^2}{e^3 + e^2} \right] = \left[\frac{e^3}{e^3(1 + e^{-1})}, \frac{e^2}{e^2(e^1 + 1)} \right] = [0.73, 0.27] \Rightarrow \text{Attention weights}$$

(4) Here, the attention weights are more balanced compared to the unscaled case

Summary of Importance

Stabilizing Training: Scaling prevents extremely large dot products, which helps in stabilizing the gradients during backpropagation, making the training process more stable and efficient.

Preventing Saturation: By scaling the dot products, the softmax function produces more balanced attention weights, preventing the model from focusing too heavily on a single token and ignoring others.

Improved Learning: Balanced attention weights enable the model to learn better representations by considering multiple relevant tokens in the sequence, leading to better performance on tasks that require context understanding.

Scaling ensures that the dot products are kept within a range that allows the softmax function to operate effectively, providing a more balanced distribution of attention weights and improving the overall learning process of the model.

$$(4) \text{Scaling} = \sqrt{d_K} = \sqrt{4} \Rightarrow 2$$

Similarly Scaling

$$\text{Scaled-Score } (Q_{\text{The}}, K_{\text{The}}) = 2/2 = 1$$

will be done for
all other tokens.

$$\text{Scaled-Score } (Q_{\text{The}}, K_{\text{CAT}}) = 0/2 = 0$$

$$\text{Scaled-Score } (Q_{\text{The}}, K_{\text{SAT}}) = 2/2 = 1$$

(5) Apply Softmax

$$\text{ATTENTION WEIGHTS}_{\text{"The"}} = \text{Softmax}([1, 0, 1]) = [0.4223, 0.1554, 0.4223]$$

$$\text{ATTENTION WEIGHTS}_{\text{"CAT"}} = \text{Softmax}([0, 2, 2]) = [0.1554, 0.4223, 0.4223]$$

$$\text{ATTENTION WEIGHTS}_{\text{"SAT"}} = \text{Softmax}([2, 2, 4]) = [0.2119, 0.2119, 0.5762]$$

(6) Weight Sum of Values

We multiply the attention weights by corresponding value vectors

For the Token The =

$$\text{Output}_{(\text{The})} = 0.4223 * V_{\text{The}} + 0.1554 * V_{\text{CAT}} + 0.4223 * V_{\text{Sal.}}$$

$$= 0.4223 [1 \ 0 \ 1 \ 0] + 0.1554 [0 \ 1 \ 0 \ 1] + 0.4223 [1 \ 1 \ 1]$$

$$= [0.4223, 0, 0.4223, 0] + [0, 0.1554, 0, 0.1554] + [0.4223, 0.4223, \\ 0.4223, 0.4223]$$

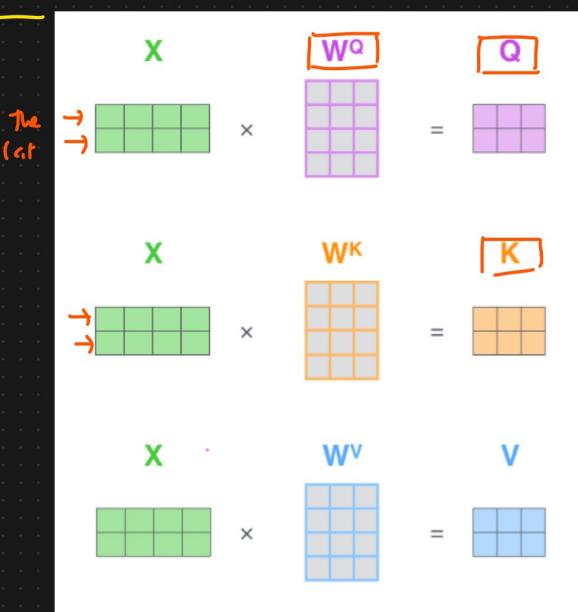

$$= [1.2669, 0.9999, 1.2669, 0.9999].$$

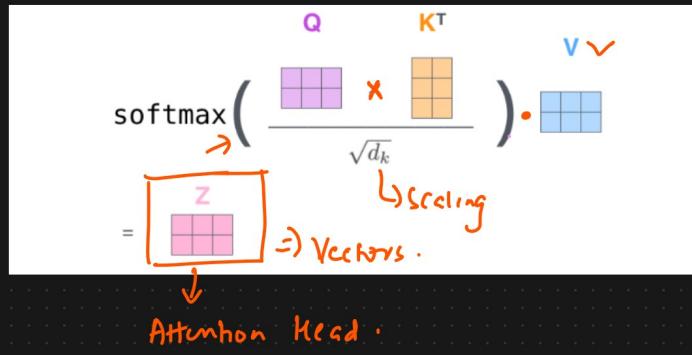

↓ Contextual
vector

The 1 1 0 1 1 0 \Rightarrow Self Attention $\Rightarrow [1.2669, 0.9999, 1.2669, 0.9999].$

Types of Position Encoding

1) Sinusoidal Position Encoding →

2) Learned Positional Encoding ⇒ Positional Encoding Are learned during Training ↲

① Sinusoidal Positional Encoding : It uses Sinc and Cosine functions

of different frequencies to create positional encodings

Formula :

$$P.E(pos, 2i) = \sin\left(\frac{pos}{10000^{2i/d_{model}}}\right)$$

Where pos is the position
 i is the dimension

$$P.E(pos, 2i+1) = \cos\left(\frac{pos}{10000^{2i/d_{model}}}\right).$$

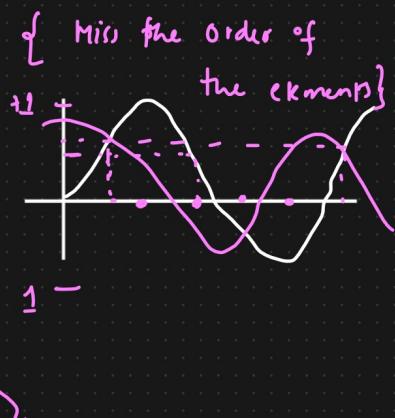

d_{model} is the dimensionality of the embeddings.

Eg: The Cat Sat

$$\text{The} \rightarrow [0.1 \ 0.2 \ 0.3 \ 0.4]$$

$$\text{CAT} \rightarrow [0.5 \ 0.6 \ 0.7 \ 0.8]$$

$$\text{SAT} \rightarrow [0.9 \ 1.0 \ 1.1 \ 1.2]$$

$$PE(pos, 2i) = \sin\left(\frac{pos}{10000^{2i/d_{model}}}\right) \quad PE(pos, 2i+1) = \cos\left(\frac{pos}{10000^{2i/d_{model}}}\right)$$

For our example $d_{model} = 4$

For position $pos = 0$

$$PE(0,0) = \sin\left(\frac{0}{10000^0/4}\right) = \sin(0) = 0$$

$$PE(0,1) = \cos\left(\frac{0}{10000^1/4}\right) = \cos(0) = 1$$

$$PE(0,2) = \sin\left(\frac{0}{10000^2/4}\right) = \sin(0) = 0$$

$$PE(0,3) = \cos\left(\frac{0}{10000^3/4}\right) = 1$$

$$PE = [0, 1, 0, 1]$$

$$PE(pos, 2i) = \sin\left(\frac{pos}{10000^{2i/d_{model}}}\right)$$

For $pos = 1$

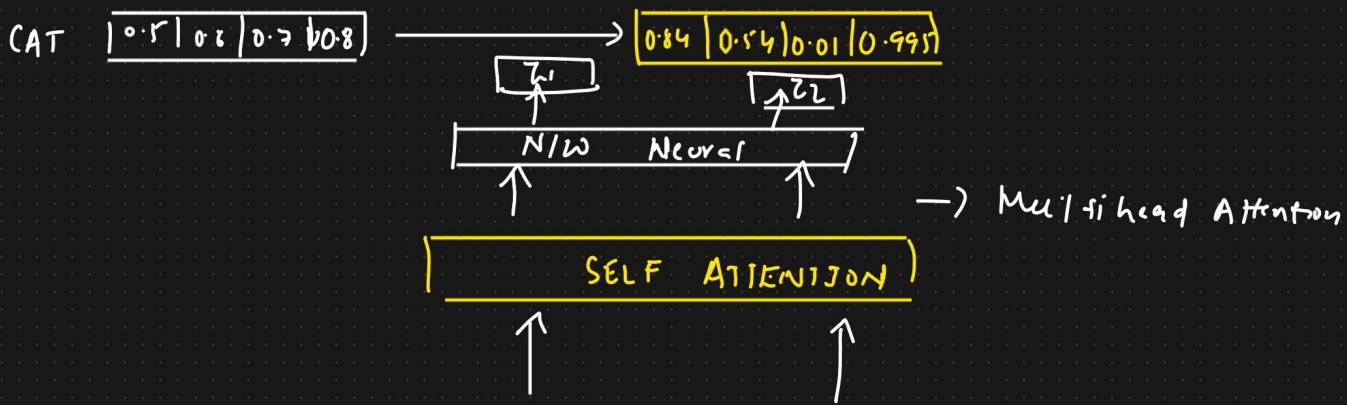

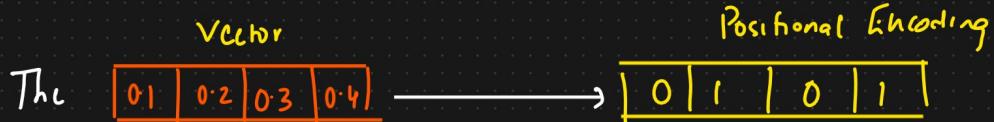

$$PE(1,0) = \sin\left(\frac{1}{10000^0/4}\right) = \sin(1) = 0.8415$$

$$PE(pos, 2i+1) = \cos\left(\frac{pos}{10000^{2i/d_{model}}}\right)$$

$$PE(1,1) = \cos\left(\frac{1}{10000^1/4}\right) \approx 0.5403$$

$$PE(1,2) = \sin\left(\frac{1}{10000^2/4}\right) \approx 0.01$$

$$PE(1,3) = \cos\left(\frac{1}{10000^3/4}\right) \approx 0.99995$$

Positional Encoding

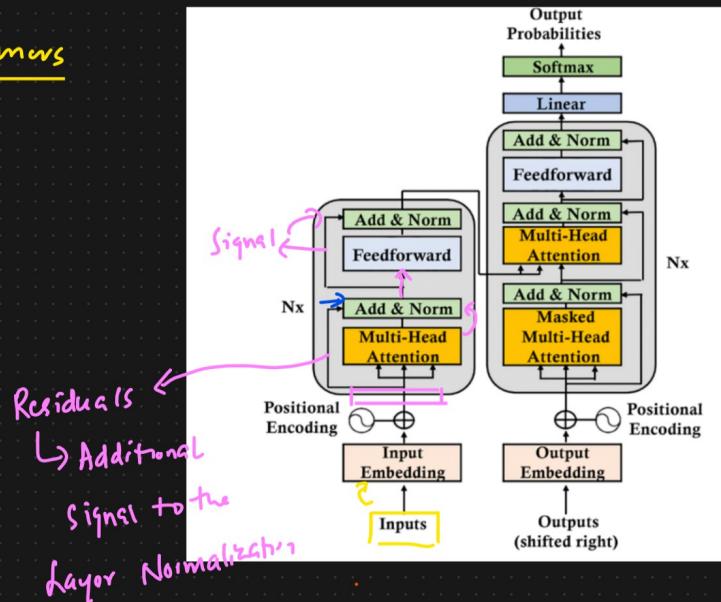

$$\begin{matrix} 0.84 & 0.79 & 0.01 & 0.99 \end{matrix} + \begin{matrix} 0.5 & 0.6 & 0.7 & 0.8 \end{matrix} = \begin{matrix} 1.0 & 1.0 & 0.1 & 0.4 \end{matrix}$$

CAT → Thc .

$$Y = \begin{bmatrix} 1.0, 1.0, 1.0, 1.0 \end{bmatrix} \quad J^3 = \begin{bmatrix} 0.0, 0.0, 0.0, 0.0 \end{bmatrix}.$$

$$y_i = \gamma_i \hat{x}_i + \beta_i$$

$$Y = \begin{bmatrix} -1.34, -0.45, 0.45, 1.34 \end{bmatrix}.$$

④ Encoder Architecture [Research Paper]

The diagram illustrates the Transformer architecture's processing flow:

- Input Sequence** (J/P Sequence) is processed by **Text Embeddings + Positional Encoding**.
- This leads to **Multi Head Attention**, which produces outputs Z_1, Z_2, Z_3, Z_4, Z_5 .
- The Multi Head Attention output is combined with the original **Text Embeddings + Positional Encoding** via a **Residual Connection** and **Add And Norm**.
- This result then passes through a **Feed Forward NN.**
- The final output consists of 12 words, where each word is represented by a sequence of 10 numbers.

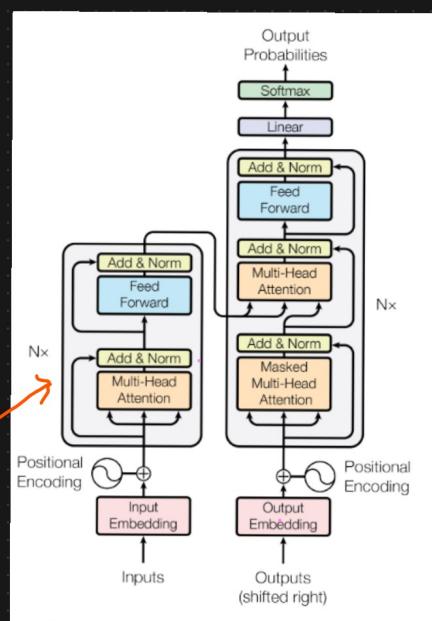

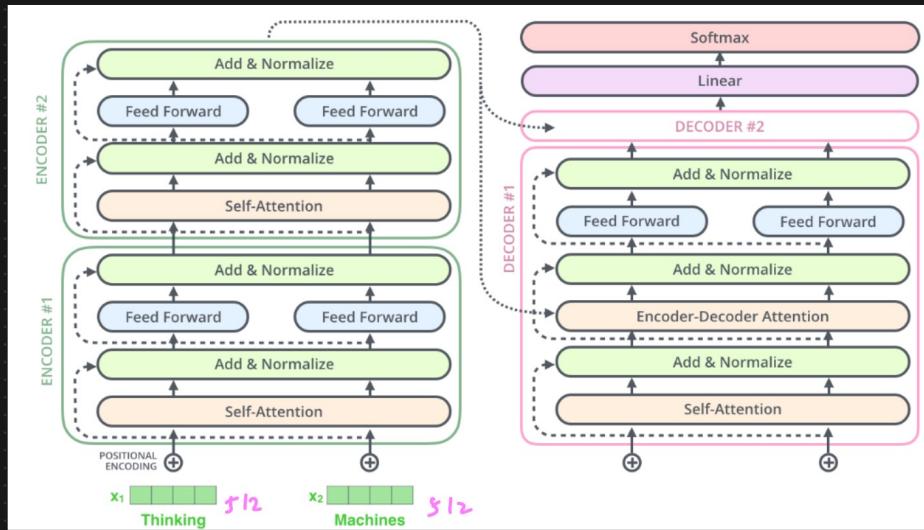

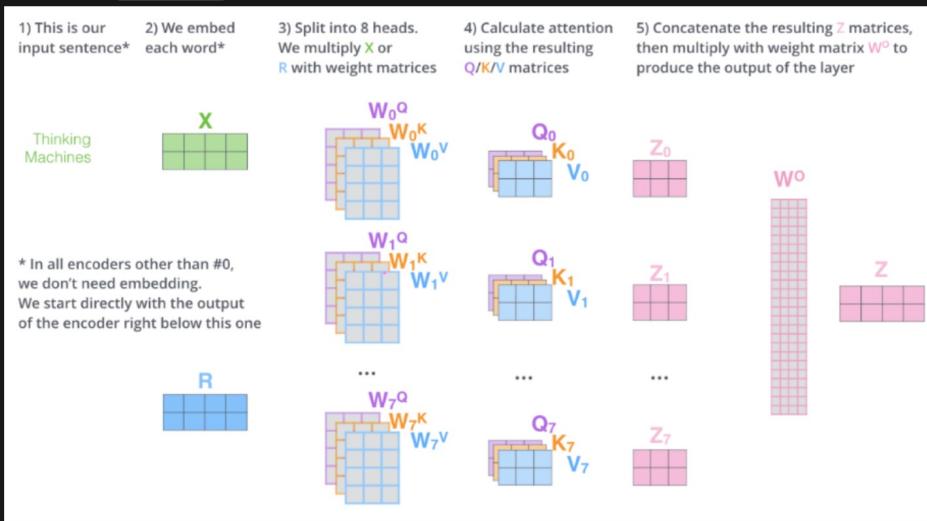

Figure 1: The Transformer - model architecture.

Self Attention to Feed Forward Neural N/W

$$\text{Scores} = Q \times K^T / \sqrt{d_K}$$

$$= Q \times K^T / 2$$

$$\begin{bmatrix} 0.1 \times 0.1 + 0.2 \times 0.2 + 0.3 \times 0.3 + 0.4 \times 0.4, \\ 0.1 \times 0.5 + 0.2 \times 0.6 + 0.3 \times 0.7 + 0.4 \times 0.8, \\ 0.1 \times 0.9 + 0.2 \times 1.0 + 0.3 \times 1.1 + 0.4 \times 1.2 \\ 0.1 \times 0 + 0.2 \times 0 + 0.3 \times 0 + 0.4 \times 0 \end{bmatrix}$$

Score : $\left[\begin{bmatrix} 0.3, 0.7, 1.1, 0.0 \\ 0.7, 1.9, 3.1, 0.0 \\ 1.1, 3.1, 5.1, 0.0 \\ 0.0, 0.0, 0.0, 0.0 \end{bmatrix} \right]$

④ Masked Application

It helps manage the structure of the sequences being processed and ensures the model's behavior correctly during training and inference.

Reasons

① Handling Variable length Sequences with Padding MASK

Purpose

- ① To handle sequences of different length in batch
- ② To ensure that padding tokens, which are added to make sequences of uniform length, do not affect the model prediction

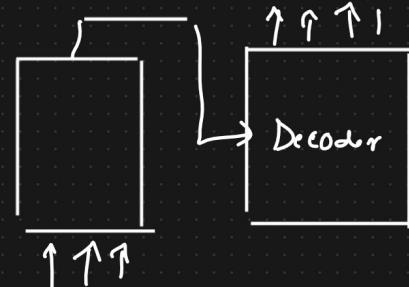

Eg: $\text{inp} \leftarrow \text{Sequence 1} [1, 2, 3] \rightarrow \text{Op} [y_1, y_2, 0, 0, 0]$

$\text{inp} \leftarrow \text{Sequence 2} [4, 5, \boxed{0}]$ 0 is the padding token
 → Influence the Attention Mechanism
 $\rightarrow 100.$ ↓
 lead to Incorrect or biased predictions.

A padding mask \Rightarrow The tokens are ignored.

Masking \rightarrow Padding Mask } } Padding Mask $\left[\begin{array}{ccc} 1 & 1 & 1 \\ 1 & 1 & 0 \end{array} \right]$
 \rightarrow Look Ahead Mask .

② Look Ahead Mask → Maintain Auto Regressive Property

How Anyo

- ① To ensure that each position in the decoder output sequence can only attend to the previous position, but no future position

- ② Sequence → Language Modelling, Translation

Eg: $[4, 5, 0] \rightarrow [1, 1, 0]$ → 1D MASK.

Attention ← to token 1, 2
Mechanism 1, 2
Token 1 attends

$$\begin{bmatrix} 1 & 1 & 0 \\ 1 & 1 & 0 \\ 0 & 0 & 0 \end{bmatrix}$$

Convert 1D to 2D mask

For each token in the sequence, the mask should indicate which tokens it can attend to.

* Look Ahead Mask → Decoder Output

$$\left[\begin{bmatrix} 1 & 0 & 0 \\ 1 & 1 & 0 \\ 1 & 1 & 1 \end{bmatrix} \right]$$

A) Combine Padding And Looking Ahead Mask

Element wise multiplication of 2 mask

Combine Mask = $\begin{bmatrix} [1, 0, 0] \\ [1, 1, 0] \\ [0, 0, 0] \end{bmatrix}$

④ MASK

$$\text{Scores} : \begin{bmatrix} [0.3, 0.7, 1.1, 0.0] \\ [0.7, 1.9, 3.1, 0.0] \\ [1.1, 3.1, 5.1, 0.0] \\ [0.0, 0.0, 0.0, 0.0] \end{bmatrix}$$

Look Ahead Mask

$$\begin{bmatrix} [1, 0, 0, 0] \\ [1, 1, 0, 0] \\ [1, 1, 1, 0] \\ [1, 1, 1, 1] \end{bmatrix}$$

Padding Masking [extended to 2D Format]

$$\begin{bmatrix} [1, 1, 1, 0] \\ [1, 1, 1, 0] \\ [1, 1, 1, 0] \\ [0, 0, 0, 0] \end{bmatrix}$$

Combined Mask = Look Ahead Mask + Padding Mask

$$\begin{bmatrix} [1*1, 0*1, 0*1, 0*0] \\ [1*1, 1*1, 0*1, 0*0] \\ [1*1, 1*1, 1*1, 0*0] \\ [1*1, 1*1, 1*1, 1*0] \end{bmatrix} = \begin{bmatrix} [1, 0, 0, 0] \\ [1, 1, 0, 0] \\ [1, 1, 1, 0] \\ [1, 1, 1, 0] \end{bmatrix} \Rightarrow \begin{bmatrix} [1, -\infty, -\infty, -\infty] \\ [1, 1, -\infty, -\infty] \\ [1, 1, 1, -\infty] \\ [1, 1, 1, -\infty] \end{bmatrix}$$

Masked Score

$$\begin{bmatrix} [0.3, -\infty, -\infty, -\infty] \\ [0.7, 1.9, -\infty, -\infty] \\ [1.1, 3.1, 5.1, -\infty] \\ [0.0, 0.0, 0.0, -\infty] \end{bmatrix}$$

Zero out the influence when the softmax is applied.

Attention weight.

Softmax

Softmax Score = Softmax (Masked Scores)

$$= \left[\begin{bmatrix} 1.0, 0.0, 0.0, 0.0 \end{bmatrix}, \begin{bmatrix} 0.3, 0.7, 0.0, 0.0 \end{bmatrix}, \begin{bmatrix} 0.1, 0.3, 0.6, 0.0 \end{bmatrix}, \begin{bmatrix} 1.0, 0.0, 0.0, 0.0 \end{bmatrix} \right]$$

Weight Sum of Value

Attention O/p = Softmax Scores * V.

Masking

Masking in the transformer architecture is essential for several reasons. It helps manage the structure of the sequences being processed and ensures the model behaves correctly during training and inference. Here are the key reasons for using masking:

1. Handling Variable-Length Sequences with Padding Mask

Purpose

To handle sequences of different lengths in a batch.

To ensure that padding tokens, which are added to make sequences of uniform length, do not affect the model's predictions.

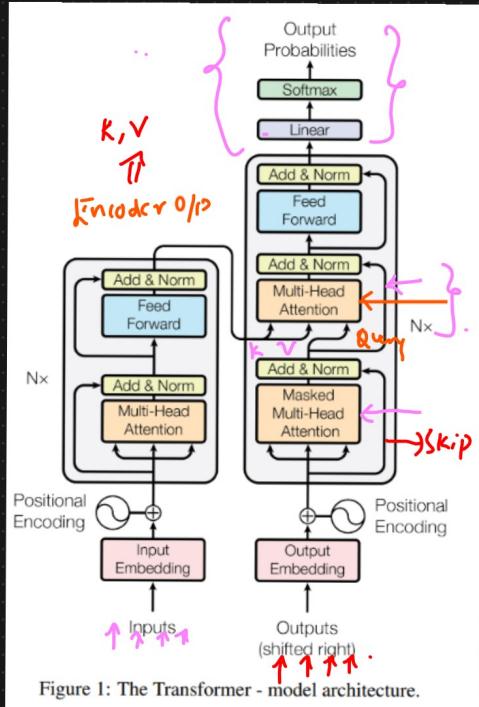

2. Maintaining Autoregressive Property with Look-Ahead Mask

Purpose

To ensure that each position in the decoder output sequence can only attend to previous positions and itself, but not future positions.

This is crucial for sequence generation tasks like language modeling and translation, where the model should not have access to future tokens when predicting the current token.

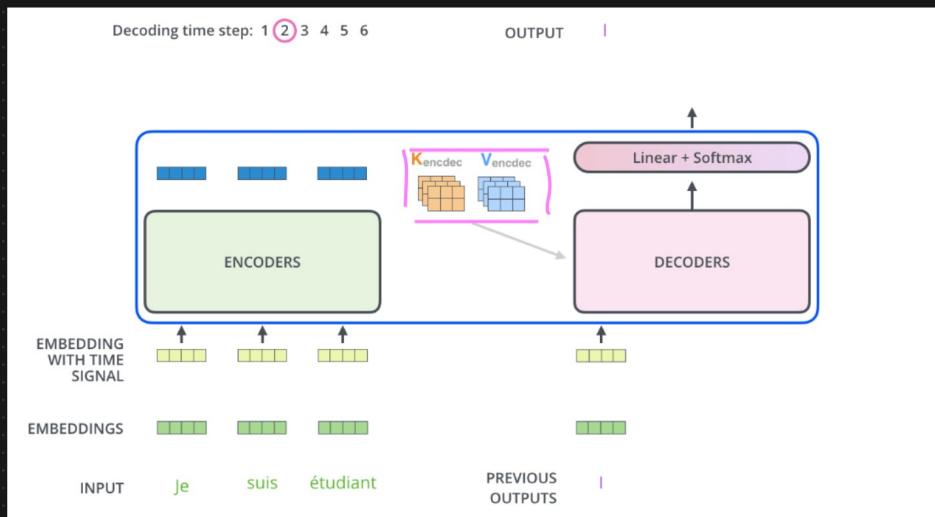

④ Encoder Decoder Multi Head Attention

- ① Encoder Out \rightarrow Set of Attention Vector K & V
 - ② Masked Multihed \rightarrow Attention Vector Q {Query Vector}

These are to be used by each decoder in its
"Encoder-decoder" attention layer
 \Downarrow

$$\underline{Dg + \epsilon g f}$$

④ The Final Linear And Softmax Layer { Vectors → o/p Word }

{ BLOG } ⇒ Transformers

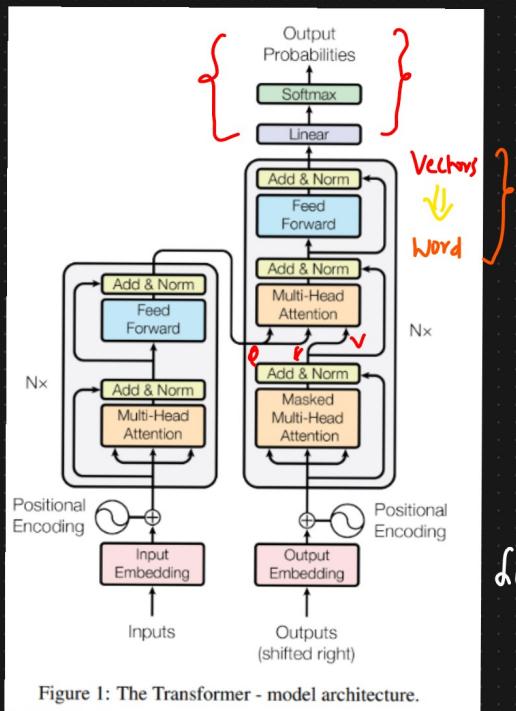

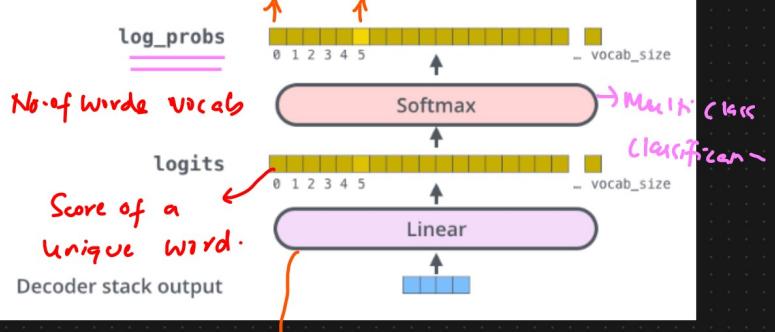

Figure 1: The Transformer - model architecture.

Which word in our vocabulary is associated with this index?

Get the index of the cell with the highest value (argmax)

linear ⇒ The linear layer is a simple fully connected neural net that projects the vector produced by the stack of Decoder ⇒ logits vector ⇒

Model = 10,000 ⇒ Vocabulary ⇒ logits vector = 10000 cells wide

② Softmax layer turns those scores into probabilities (all add up to 1.0).

The cell with the highest probability is chosen, and the word associated with it is produced as the o/p. = time stamp.

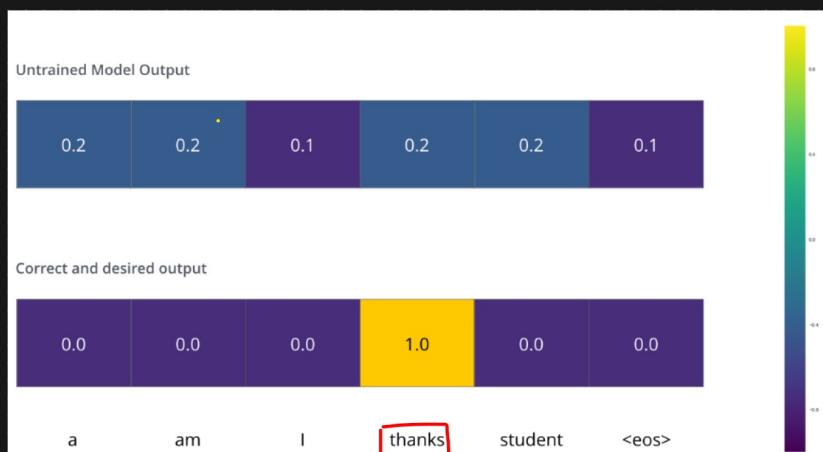

Recap of Training

Output Vocabulary						
WORD	a	am	I	thanks	student	<eos>
INDEX	0	1	2	3	4	5

Output Vocabulary						
WORD	a	am	I	thanks	student	<eos>
INDEX	0	1	2	3	4	5
One-hot encoding of the word "am"						
	0.0	1.0	0.0	0.0	0.0	0.0
